# Multimodal Therapy (MMT) for Children with ADHD

#### Program description:

These treatments target more than one setting with psychosocial interventions. For instance, many therapies intervene with both parents and teachers or children. In this analysis, all studies utilized either behavioral or cognitive-behavioral orientations.

Typical age of primary program participant: 8

Typical age of secondary program participant: N/A

**Meta-Analysis of Program Effects** 

Outcomes Measured	Primary or Second-	No. of Effect Sizes	(Random Effects Model)			Adjusted Effect Sizes and Standard Errors Used in the Benefit-Cost Analysis					
	ary Partici- pant		ES	SE	p-value		st time ES estimated SE	is Age	Se ES	cond time estimate SE	
Test scores	Р	5	0.02	0.08	0.79	0.03	0.08	8	0.01	0.04	17
Disruptive behavior disorder symptoms	Р	7	-0.29	0.13	0.02	-0.19	0.13	8	-0.08	0.05	13
Attention deficit hyperactivity disorder symptoms	Р	9	-0.18	0.12	0.14	-0.08	0.12	8	-0.03	0.05	13

**Benefit-Cost Summary** 

	Program Benefits			Costs	Summary Statistics			ice		
The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2011). The economic discount rates and other relevant parameters are described in Technical Appendix 2.	Participants	Tax- payers \$440	Other	Other Indirect \$217	Total Benefits \$1,749	-\$8.343	Benefit to Cost Ratio	Return on		Probability of a positive net present value

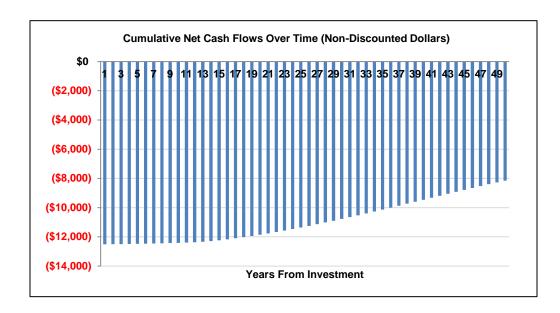

**Detailed Monetary Benefit Estimates** 

Benefits to:									
ource of Benefits	Partici- pants	Tax- payers	Other	Other In-direct	Total Benefits				
Crime	\$0	\$9	\$26	\$4	\$39				
Earnings via test scores	\$971	\$357	\$0	\$176	\$1,504				
K-12 grade repetition	\$0	\$2	\$0	\$1	\$3				
Health care costs for ADHD symptoms	\$11	\$34	\$34	\$17	\$97				
Health care costs for disruptive behavior symptoms	\$13	\$38	\$37	\$19	\$107				

## **Detailed Cost Estimates**

The figures shown are estimates of the costs to		Program Costs			nparison (	Costs	Summary Statistics			
implement programs in Washington. The comparison group costs reflect either no							Present Value of Net Program			
treatment or treatment as usual, depending on	Annual	Program	Year	Annual	Program	Year	Costs (in 2011	Uncertainty		
how effect sizes were calculated in the meta- analysis. The uncertainty range is used in	Cost	Duration	Dollars	Cost	Duration	Dollars	dollars)	(+ or – %)		
Monte Carlo risk analysis, described in Technical Appendix 2.	\$9,120	1	2010	\$950	1	2010	\$8,354	20%		

Source: Based on therapist time, as reported in the treatment studies, as well as training costs and a flat fee for materials (e.g., manuals). Hourly therapist cost was based on the latest actuarial estimates of reimbursement by modality in WA State (DSHS).

Multiplicative Adjustments Applied to the Meta-Analysis

Type of Adjustment	Multiplier
1- Less well-implemented comparison group or observational study, with some covariates.	1.00
2- Well-implemented comparison group design, often with many statistical controls.	1.00
3- Well-done observational study with many statistical controls (e.g., IV, regression discontinuity).	1.00
4- Random assignment, with some RA implementation issues.	1.00
5- Well-done random assignment study.	1.00
Program developer = researcher	0.64
Unusual (not "real world") setting	1.00
Weak measurement used	0.5

Adjustment factors were generated by examining studies for the treatment of children or adolescents with externalizing problems. Meta-regressions were conducted to test for the impact of different methodological factors on unadjusted effect size. Because research design rating and unusual setting were not significant predictors of effect size, multipliers were set to 1.0. A dummy variable representing involvement of a program developer in the research study was a statistically significant predictor (B=-.189, p=.056), indicating that such studies had significantly more negative (i.e., larger) effect sizes than studies in which the developer was not involved. This coefficient was used to determine the 0.64 multiplier. Finally, we coded as weak measures outcomes that were based solely on the report of individuals who were involved in the intervention (either delivered it, as in the case of teachers, or received it, such as parents in a parenting program). Due to concern that such measures might be biased in favor of the programs reviewed, we utilized the standard Institute multiplier (0.5).

#### **Additional Notes**

Some studies included in this analysis compared the program (MMT) to control conditions that did not consist of an active treatment. Because policymakers in Washington are interested in the impact of this program above and beyond currently implemented treatments (i.e., treatment as usual), we reduced the effect size of studies utilizing a no treatment or waitlist control group in half to reflect a smaller impact that would be expected if these studies compared MMT to treatment as usual.
